Values 5 and 6 provide the damping forces in the Compression (value 6) and decompression phase (value 5). Thus, values 5 and 6 are shock absorption Components.

Fig. 1

~8-

## BEST AVAILABLE COPY

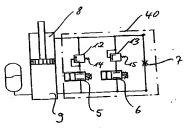

Values 5 and 6 both operate in the Compression and in the decompression phase (see double-arrow in element 5 and 6). Check-values 10 and 11 determine which one of the values 5.6 is in appealing.

Like in Fig. 1, only the values 5 and Sprovide the damping forces and thus opened as shock absorption components.

Fig. 2

## **BEST AVAILABLE COPY**

Same concept as Fis. 2, basically.
The only difference: Values 12, 13 are spring-loaded by
spring 14, 15. Thus, value 12 contributes
to the damping affect in the damping
and value 13 contributes to the damping
affect in the decompression phase.
